

Assignment Questions -2

Write a structure for student data and demonstrate how to access its members in a C program.

Develop a C program using an array of structures to store and display details of 5 employees.

Write a C program to input two strings and perform copy, concatenation, and comparison using built-in string functions.

Describe different types of pointers in C (null, void, wild, dangling, double pointer, function pointer) with examples.

Write a C program to show pointer arithmetic operations on integer pointers.

Write a C program to store data into a file using file writing functions and read the same data back from the file.

Write a C program using macros to compute square and cube of a number and demonstrate conditional compilation using #if and #elif.

Write a C program that passes a structure to a function and displays the structure data.

Write a C program to illustrate dynamic memory allocation using malloc() and free().

Compare and differentiate between structures and unions with examples.
